

Executive Summary

This dashboard provides an overview of Amazon product performance by analysing customer ratings, pricing, discounts, reviews, and product categories. The objective was to identify the best-performing products, understand the relationship between pricing and customer satisfaction, evaluate category performance, and examine customer engagement across products.

The analysis revealed that the highest-rated products consistently received ratings between 4.7 and 5.0, indicating a high level of customer satisfaction. The price analysis showed that more expensive products do not necessarily receive better ratings, suggesting that customers place greater importance on product quality and overall value than on price.

The category performance analysis showed that average ratings remain fairly consistent across categories, while customer engagement differs significantly based on the number of reviews received. Popular products, particularly in the electronics category, generated substantially more customer feedback, reflecting strong market demand.

Finally, the discount analysis highlighted that Electronics and Accessories categories offered the highest average discounts, with some products receiving discounts of up to 94%. These findings demonstrate how pricing strategies, customer reviews, and product quality work together to influence customer purchasing behavior.

Overall, the dashboard provides valuable insights that can help Amazon identify high-performing products, improve promotional strategies, optimize pricing decisions, and focus on categories with the greatest customer demand and engagement.
